Zombie Wells, Part 1: Texas oil wells are leaking toxic waste, and no one wants to pay to clean it

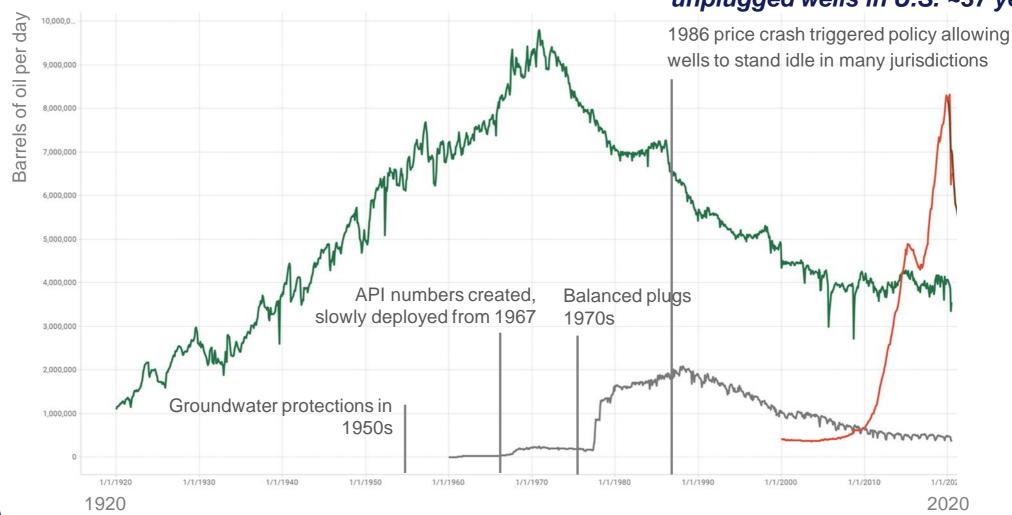

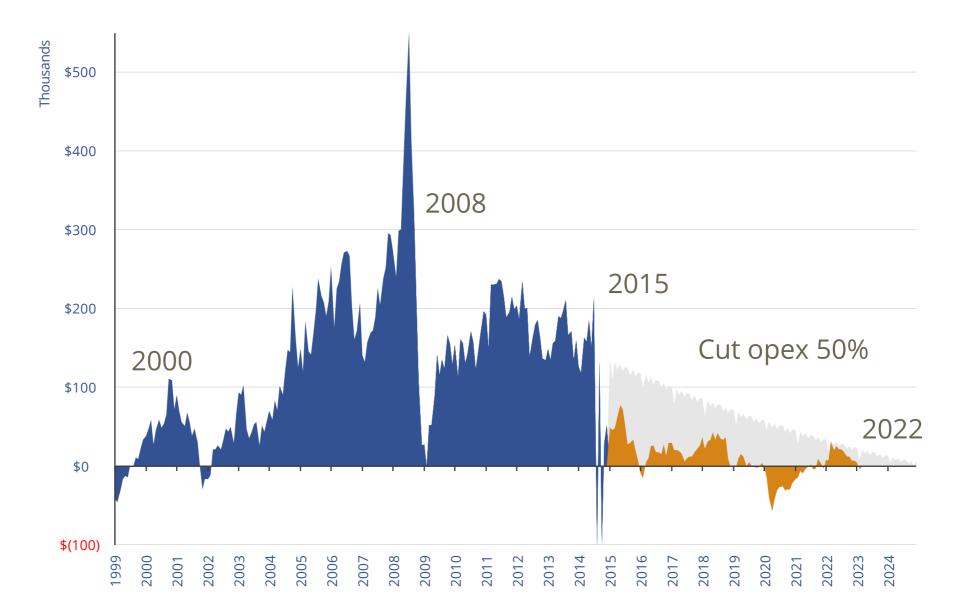

Regulatory regimes evolved

Cash flow roller-coaster, example field

Retirement is more than plugging

Downhole	Surface	
Plugging (planned ops)	Removal (wells, batteries, and central)	Restoration (pads, facilities, roads)
Salvage	Salvage	

Unplanned

Unplanned Remediation

Total cost is often multiples of planned, downhole costs. PLUS. . .

Future

Future

Production is split

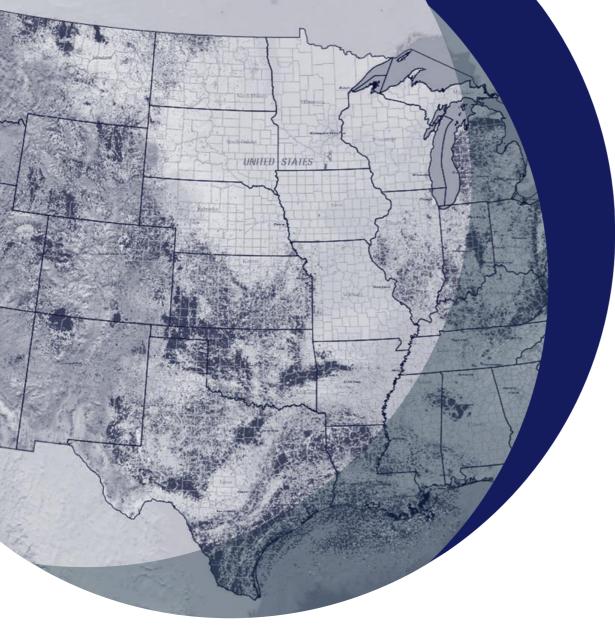

BOE per day (last 12 mos)	Well count	Share of well count	Share of production
Idle	1,483,997	59%	0%
Active injection/service wells	79,548	6%	0%
Less than 1	317,566	13%	0.4%
1 to 15	338,818	14%	8%
15 to 50	101,727	4%	13%
Greater than 50	76,263	3%	79%
TOTAL	2,397,919		

TOP
7% of wells make
92% of production

Hand-me-down sales
Ownership split

BOTTOM
72% of wells make
0.4% of production

Liabilities can exceed total future net cash flow

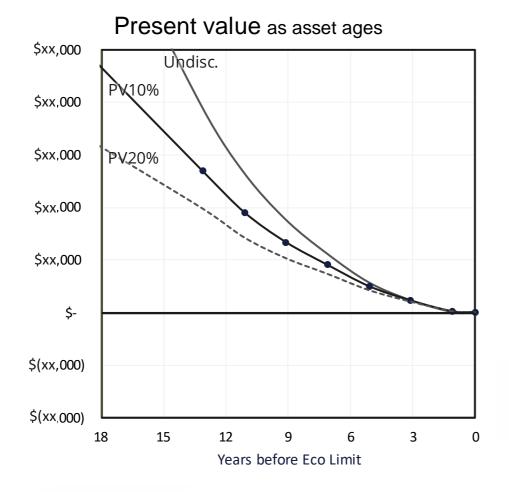

even while cash flow remains strong and NPV remains positive

Deferring retirement creates a **two-sided trap**

as assets deplete and diminish while liabilities accumulate and expand

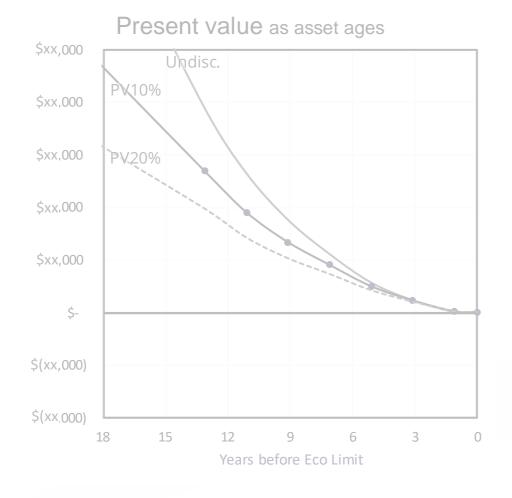

What we expect. . .

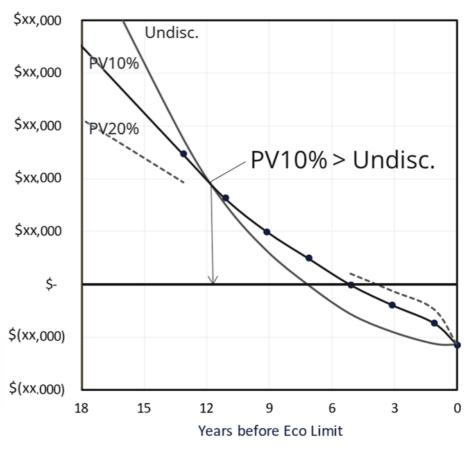

True if ADRs excluded, and mostly true if paid during economic life.

...is not what happens

Present value no longer makes economic sense

Red fill marks years when P&A liability exceeds future net income

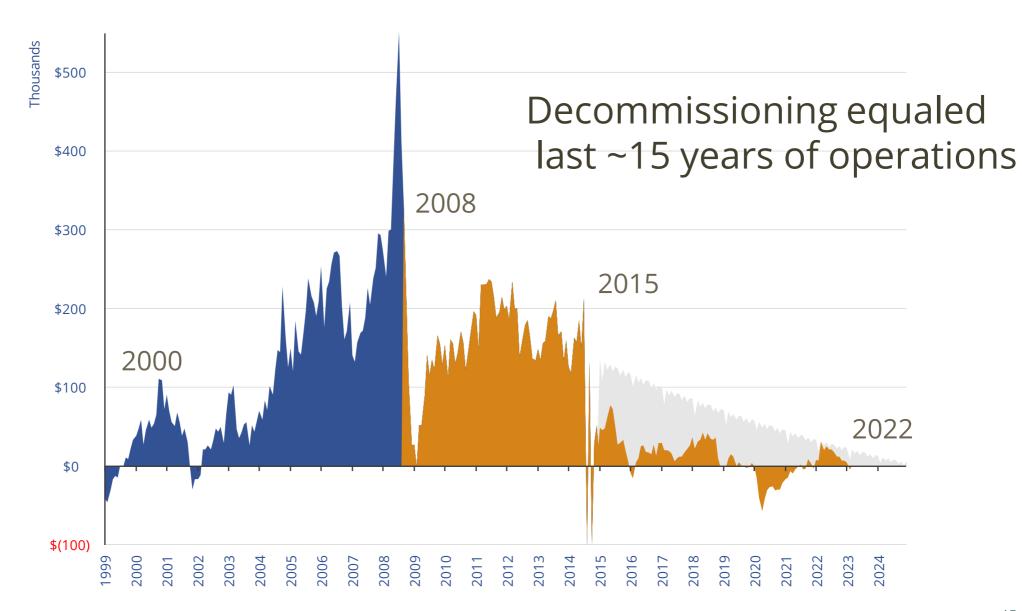

Cash flow roller-coaster, example field

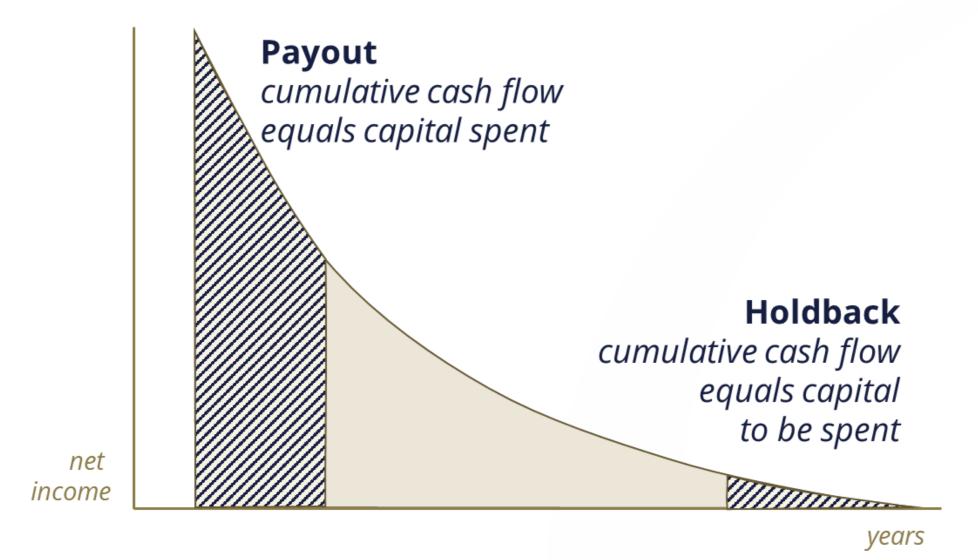

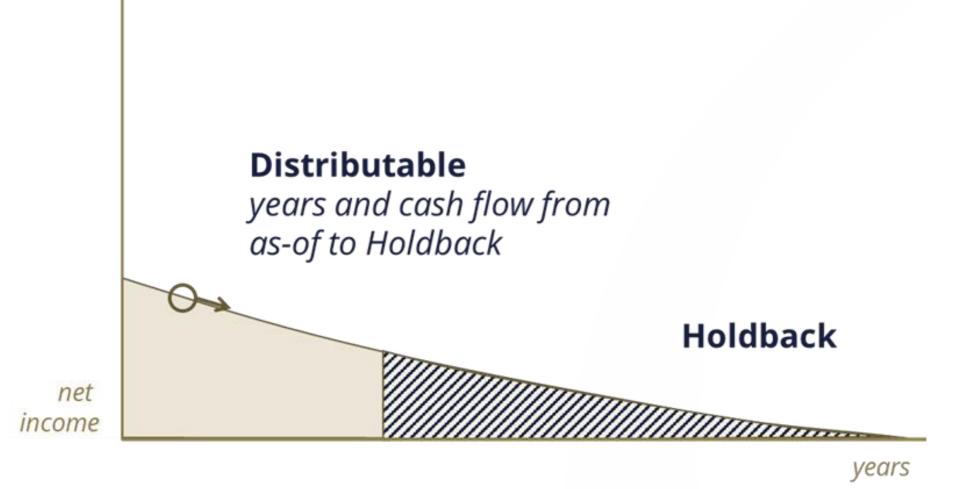

Long "holdback" period even with high prices

Other terms better describe uncertainty

Holdback

deterministic

time when future net revenue (FNR) is less

than or equal to AROs

Distributable Life

from present to start of Holdback

Holdback Coverage adds safety margin

ratio of FNR to AROs

Discounted Holdback adds risk

time when *discounted* FNR is less than or

equal to AROs

Discounted Holdback adds both risk **Coverage** and safety margin

ratio of discounted FNR to undiscounted

AROs

So...

Calculate end-of-life economic yardsticks like holdback

Talk with non-ops about funding so you are not left holding the bag alone

Change accounting and audit practices to examine end-of-life liquidity
